COM 1002 LAB 5

Q1-)Ask the user to enter the number of elements n, and then read n integers into an array.

 Write a function named findMinMax that:

- Takes three arguments:
  int *arr, int n, and two int * pointers for storing the min and max.

- Uses **pointer arithmetic** to find the minimum and maximum values in the array.

- Stores the minimum and maximum values via the pointer parameters.

    -Example:

Enter number of elements: 6

Enter elements: 15 8 22 4 18 7

Minimum value: 4

Maximum value: 22

    -Example2 :

Enter number of elements: 5

Enter elements: 4 12 3 9 0

Minimum value: 0

Maximum value: 12
